

Community

For now please use OpenWebBeans mailing-lists, JIRA and IRC channel.

See [OpenWebBeans Community](#) page for more details.

Source code

Source code can be found at <https://gitbox.apache.org/repos/asf/openwebbeans-meecrowave.git>

```
$> git clone https://gitbox.apache.org/repos/asf/openwebbeans-meecrowave.git
```

A mirror is available on github at <https://github.com/apache/openwebbeans-meecrowave>.

The github mirror is linked in both directions. That means it doesn't matter whether you push to GitHub or Apache GitBox.

Build it

To build the project just run maven:

```
mvn clean install
```

Example Source Code

The Apache Meecrowave community also hosts some examples which show how Meecrowave is to be used. Those examples are hosted in a separate repository and can be found at <https://github.com/apache/openwebbeans-meecrowave-examples>

The github repo works fine for pull requests. Please use our official [Meecrowave Bug Tracker](#) for reporting bugs or enhancement requests.

The canonical repository hosted directly at the Apache Software Foundation intended to be used by committers is

```
git clone https://gitbox.apache.org/repos/asf/openwebbeans-meecrowave-examples.git
```
